

Trelleborg, Sweden
November 2016

To whom it may concern:

Statement:

Flint Group Narrow Web offers customers low migration UV curable inks that are food packaging compliant with Swiss Ordinance, SR 817.023.21 listing and the Nestlé Guidance Note on Packaging Inks (February 21st, 2014). However, the latest version of the Nestlé Guidance Note on Packaging Inks (August 2016) restricts not only the addition of Bisphenol A (BPA), but also the use of BPA based raw materials.

Our current portfolio of UV curable low migration ink products do not contain any added Bisphenol A (BPA) or BPA derivatives, but BPA is used as a starting molecule in some raw materials.

Therefore, as we work over the next 12 months to develop UV curable inks that are in compliance with the new Nestlé Guidance Note (August 2016), we have an agreement with the Head of Nestlé Packaging Safety that our current portfolio of low migration UV curable inks are acceptable for use and meet the Nestlé Guidance Note. Our target for transition to the new inks is September 2017.
